

SCOPE OF WORK

Inventory Management System – Yogyaam Foods

Technical Documentation

Document Type: Scope of Work (SOW)

Client: Yogyaam Foods

Version: 1.0

Date: 10 August 2026

Status: Draft

1. Introduction

This document defines the Scope of Work (SOW) for the design and development of the Inventory Management System for Yogyaam Foods. It outlines the functional modules, features, and data requirements to be delivered as part of the system, serving as the reference baseline for development, review, and sign-off.

2. Project Overview

The Inventory Management System is a web-based application intended to help Yogyaam Foods manage its end-to-end retail and inventory operations — from product cataloguing and stock purchases to sales billing, delivery, invoicing, payments, and multi-branch staff and customer administration. The system will provide a central dashboard for business insights and dedicated modules for each operational function described below.

3. Scope of Work

The scope of work is organized into the following functional modules. Each module and its corresponding features, fields, and table structures are detailed in the sections that follow.

- 1. Dashboard
- 2. Products
- 3. Combo Offers
- 4. Sales and Billing
- 5. Payment
- 6. Purchase Stock
- 7. Package and Delivery
- 8. Invoices
- 9. Accounts
- 10. Roles and Permissions

3.1 Dashboard

INTRODUCTION

The Dashboard is the landing screen of the Inventory Management System, presenting a consolidated, visual snapshot of the business's day-to-day performance as soon as a user logs in.

PURPOSE

To give management and staff a quick, at-a-glance understanding of key business metrics without having to navigate into individual modules.

FEATURES

- KPI cards summarizing key metrics: Total Products, Sales, Staff, and Delivered orders.
- Analytical charts, including product distribution, sales distribution, and other relevant business charts.

NEED OF THE MODULE

Business owners and branch managers need a fast way to gauge overall performance and spot issues (e.g., low stock, dip in sales) without manually compiling data from multiple modules. The Dashboard removes this manual effort and supports quicker, data-driven decisions.

WORKING OF THE MODULE

On login, the system aggregates live data from the Products, Sales, Staff, and Delivery modules and renders it as KPI cards and charts. Data refreshes automatically as new transactions occur, so the figures always reflect the current state of the business.

3.2 Products

INTRODUCTION

The Products module is the core catalogue management area of the system, where all items sold or stocked by Yogyaam Foods are recorded, organized, tracked, and labelled.

PURPOSE

To maintain a single, accurate source of product information — covering stock levels, pricing, expiry, and vendor details — and to make that information easy to search, filter, and act upon.

FEATURES

All Products

- Display a list of all products in a tabular format.
- Table columns: Name, Category, Quantity, Price, Expiring Date, Vendor, Threshold, Alert Actions.
- Filter products based on configurable conditions, including Search, Category, Alert Level (High, Medium, Low), Expiry Status (Yes/No), and additional filters as required.

Barcode Integration

- Filter the product list on the basis of Name and Category.
- Print barcodes for selected products. There are 2 options for printing: A4 sheet 3 x 7 grid and Thermal Roll 58 mm / 80 mm.
- Barcode print list columns: Sr. No., Checkbox & Print Copies option, Product Name & ID, Barcode ID (visual barcode), Category, Price, Weight/Pack.

Add Product

- Add Product modal with fields: Name, Category, Description, Quantity, Pack Based, Pack Size, Selling Price, Expiry Date, Vendor, Threshold Value.
- Export product data to Excel.

Categories

- Add a product category using a category name.

NEED OF THE MODULE

As a food business, Yogyaam Foods must track perishability, stock thresholds, and vendor sourcing accurately to avoid stockouts, wastage, and billing errors. A dedicated Products module ensures every item is uniquely identifiable (via barcode) and that low-stock or near-expiry items are flagged before they become a problem.

WORKING OF THE MODULE

Staff add new products through the Add Product modal, which stores the item along with its category, packaging, pricing, and threshold values. The All Products view lists this data with filters for quick lookup and highlights alerts when stock falls below threshold or nears expiry. Selected products can be sent to the barcode screen for label printing, and the full catalogue can be exported to Excel for offline use or reporting.

3.3 Combo Offers

INTRODUCTION

The Combo Offers module allows the business to bundle multiple products together and sell them as a single discounted package.

PURPOSE

To support promotional bundling and upselling by letting staff configure combo packages with their own pricing rules, separate from individual product prices.

FEATURES

- Display all combo offers with columns: Combo ID, Name, Category, Minimum Products, Is Active, Created At, Actions.
- Create a combo offer including: Name, Category, Minimum Products, Actual Price, Combo Price, Is Active status, and Combo Items (Item, Quantity, Item Price, Order).

NEED OF THE MODULE

Bundled offers are a common way to move slower-selling stock, increase average order value, and run promotions. Without a dedicated module, staff would have to manually calculate combo pricing at billing time, increasing the chance of error.

WORKING OF THE MODULE

An authorized user creates a combo by selecting a name, category, and minimum number of products required, then adds the individual combo items with their quantities and prices. The system calculates the combo price against the actual (sum) price so the discount is transparent. Active combos become selectable as a single line item during sales billing.

3.4 Sales and Billing

INTRODUCTION

The Sales and Billing module handles point-of-sale transactions — from adding items to a cart through to calculating totals, discounts, tax, and final payment.

PURPOSE

To provide a fast, accurate billing workflow for staff at the counter, and a complete, exportable record of every sales order for accounting and analysis.

FEATURES

Sales Order Listing

- Display sales orders with columns: ID, Date & Time, Customer, Gross Total, Discount Amount, Sub Total (Total – Discount), Tax Amount, Tax Percentage, Grand Total, Coins Balance, Final Pay, Amount Paid, Amount Change, Staff, Amount Status, Invoice.
- Export the complete sales data.

Create Sales Order

- Capture Customer, Sub Total, Discount Percentage, Discount Amount, Tax Percentage, Tax Amount, Grand Total, Amount Paid, Redeem Purchase Coins, and Final Amount to Pay.
- Add items by scanning barcode, entering a product code, or selecting the product by name.
- Item table columns: Sr. No., Name, Price, Quantity, Loose (checkbox), Total, Actions (Delete).

NEED OF THE MODULE

Billing is the most frequent and time-sensitive activity in the store; it must be quick, minimize manual entry errors, and correctly apply discounts, taxes, and loyalty coins. A structured billing module also ensures every sale is logged for downstream accounting, delivery, and invoicing.

WORKING OF THE MODULE

The cashier starts a new sales order, adds items by scanning a barcode or searching by name/code, and the system builds the item table with live totals. Discount and tax percentages are applied automatically to compute the grand total, and customers may redeem loyalty coins to reduce the final payable amount. On completion, the order is saved and appears in the Sales Order Listing, from where it can be tracked, reviewed, or exported.

3.5 Payment

INTRODUCTION

The Payment module manages the business's UPI payment configuration and provides a consolidated log of digital payments received.

PURPOSE

To let the business receive and reconcile UPI payments against sales and subscriptions from within the same system used for billing.

FEATURES

- Configure UPI beneficiary details: Organization Name, UPI ID, Admin Password.
- UPI payment list covering sales and subscription payments, displayed in a table with columns: Payment Type, Reference ID, Date, Mode, Customer, Amount Paid, Status.

NEED OF THE MODULE

As digital payments become the norm, the business needs a secure, admin-controlled way to configure its UPI receiving details and a reliable record of which payments succeeded, failed, or are pending, in order to reconcile daily collections and resolve customer disputes.

WORKING OF THE MODULE

An administrator configures the organization's UPI ID and beneficiary details once, protected by an admin password. During billing or subscription renewal, payments made via UPI are logged automatically against their reference ID, mode, and status, and can be reviewed in the UPI payment list at any time.

3.6 Purchase Stock

INTRODUCTION

The Purchase Stock module manages the procurement side of inventory — recording purchase orders raised with vendors and tracking their delivery.

PURPOSE

To ensure incoming stock is properly ordered, tracked, and reconciled against vendors, keeping product quantities in the system up to date.

FEATURES

- Table displaying all purchased stock data with columns: ID, Name, Quantity, Price, Delivery Status, Delivery Date, Vendor, Staff, Actions.
- Bulk order purchase workflow: download a template, populate it, and upload for bulk data entry.
- Export purchase data option.
- Add Purchase Order with fields: Item, Vendor, Price per Item, Quantity, Delivery Status, Delivery Date, Description.

NEED OF THE MODULE

Manual procurement tracking (spreadsheets, paper) makes it hard to know what has been ordered, what is pending delivery, and what has already arrived. A dedicated module keeps procurement, delivery status, and vendor accountability in one place, and bulk upload saves time when ordering many items at once.

WORKING OF THE MODULE

Staff raise a purchase order by selecting the item, vendor, quantity, and price, or upload a bulk order file using the provided template for larger orders. Each order is tracked through its delivery status until marked delivered, at which point the corresponding product quantities are expected to be updated in the Products module. The full purchase history can be exported for vendor reconciliation.

3.7 Package and Delivery

INTRODUCTION

The Package and Delivery module tracks the fulfilment of sales orders that require delivery to a customer's address.

PURPOSE

To give staff visibility into which sales orders are pending, in transit, or delivered, and to capture the delivery details needed to complete them.

FEATURES

- Table displaying delivery data with columns: ID, Sales ID, Customer Name, Contact, Address, Delivery Date, Delivery Status, Actions (Edit, Delete).
- Add Delivery with fields: Sales ID, Phone Number, Location, Date, Is Delivered.

NEED OF THE MODULE

Once a sale involves home delivery rather than an in-store handover, the business needs to track it separately to ensure the order actually reaches the customer and to answer delivery-status queries quickly.

WORKING OF THE MODULE

For a sales order that requires delivery, staff create a delivery record linked to the Sales ID, capturing the customer's contact number, delivery location, and date. The record's status is updated as the order moves through fulfilment, and it can be edited or removed as needed until marked delivered.

3.8 Invoices

INTRODUCTION

The Invoices module generates and manages formal invoices for customer orders, separate from the point-of-sale bill.

PURPOSE

To provide customers and the business with a proper invoice document covering item-wise pricing, quantities, and shipping charges, suitable for record-keeping and accounting.

FEATURES

- Table displaying all invoices with columns: ID, Customer Name, Phone Number, Item, Price per Item, Quantity, Total, Shipping, Grand Total, Actions.
- Create Invoice with fields: Customer Name, Contact Number, Item, Price per Item, Quantity, Shipping & Handling.

NEED OF THE MODULE

Certain orders — particularly larger or delivery-based ones — require a formal invoice with shipping and handling charges clearly broken out, which a standard sales bill may not capture. A dedicated Invoices module keeps this documentation organized and retrievable.

WORKING OF THE MODULE

Staff create an invoice by entering the customer's details, selecting items with their price and quantity, and adding shipping and handling charges to arrive at the grand total. Generated invoices are listed centrally, from where they can be viewed, reprinted, or managed as needed.

3.9 Accounts

INTRODUCTION

The Accounts module is the administrative backbone of the system, covering the master data for Branches, Staff, Customers, and Vendors that the rest of the application depends on.

PURPOSE

To centrally manage the people and entities the business deals with — its branches, employees, customers, and suppliers — so this information can be consistently referenced across every other module.

FEATURES

Branches

- Add Branch with fields: Branch Name, Address, Phone Number, Is Active.
- Display all branches with columns: Name, Phone, Address, Is Active, Created At, Actions.

Staff

- Display all staff with columns: Branch ID, Branch Name, Profile Image, Username, Phone Number, Status, Role, Actions.
- Create/Add Staff with fields: Telephone, Role (Operation, Executive, Admin), Status, Branch, Username, Email, Password.

Customer

- Display all customers with columns: ID, First Name, Last Name, Address, Email, Phone, Loyalty Points, Discount, Discount Type, Actions.
- Create/Add Customer with fields: First Name, Last Name, Address, Email, Phone, Loyalty Points, Aadhar Number, PAN Number.
- Loyalty discount structure across five levels: Levels 1–3 at 0%, Level 4 at 20%, Level 5 at 25%.

Vendor

- Display all vendors with columns: Name, Phone Number, Email, GSTIN Number, Contact Person, Address, Actions.
- Create/Add Vendor with fields: Name, Phone Number, Email, Address, GSTIN Number, Contact Person Name.

NEED OF THE MODULE

As Yogyaam Foods operates across multiple branches with different staff roles, repeat customers, and multiple vendors, the business needs a single, role-aware place to manage this master data — controlling who can access which branch, rewarding loyal customers, and keeping vendor compliance details (like GSTIN) on record.

WORKING OF THE MODULE

Administrators register each branch and then create staff accounts against a branch with a defined role (Operation, Executive, Admin) that governs their access within the system. Customers are registered with their contact and identity details and automatically progress through loyalty discount levels based on purchase activity. Vendors are recorded with their contact and GSTIN details so they can be selected when raising purchase orders elsewhere in the system.

3.10 Roles and Permissions

INTRODUCTION

The Roles and Permissions module provides administrative control over what each user of the system is allowed to see and do, by letting the business define custom roles and assign granular permissions to them.

PURPOSE

To enforce access control across the system so that staff only interact with the modules and features relevant to their responsibilities, protecting sensitive data and operations from unauthorized use.

FEATURES

- Create custom roles beyond the default set, tailored to the business's operational structure.
- Define custom permissions for each user, controlling access at the level of individual modules and features.
- Permissions are mapped against the modules and features listed throughout this document (e.g., Products, Sales and Billing, Payment, Accounts), allowing access to be granted or restricted feature-by-feature.

NEED OF THE MODULE

As the business grows across branches and staff roles (Operation, Executive, Admin, and others), a fixed set of roles is not enough to reflect real operational needs. Some staff may need to bill sales but not manage vendors; others may need to manage stock but not view payment configuration. Custom roles and permissions ensure each user has exactly the access they need — no more, no less — reducing the risk of accidental or unauthorized changes.

WORKING OF THE MODULE

An administrator creates a custom role and, for that role, selects which modules and specific features the role can access — for example, view-only access to Reports, or full access to Sales and Billing but no access to Payment configuration. When a staff member is assigned that role, the system enforces these permissions throughout their session, showing or hiding modules and actions accordingly. Roles can be edited at any time as responsibilities change.

4. Deliverables

- Fully functional Inventory Management System covering all modules listed in Section 3.
- Responsive web-based user interface for Dashboard, Products, Combo Offers, Sales & Billing, Payment, Purchase Stock, Package & Delivery, Invoices, Accounts, and Roles & Permissions.
- Data export functionality (Excel) for Products, Sales, and Purchase Stock modules.
- Barcode generation and printing functionality for products.

5. Approval

This Scope of Work is to be reviewed and approved by the authorized representatives of Yogyaam Foods and the development team prior to the commencement of development.
